Q: Seeking examples of nested categories of finite group schemes Let \mathcal{G} be a finite group scheme. I am curious about examples of non-empty finite étale subgroup schemes \mathcal{H} of \mathcal{G} (defined as objects with the same k -points as \mathcal{G}) of the form $\mathcal{H} = \mathcal{G}/R$, where R is a subgroup of the character group of \mathcal{G} , i.e., of finite groups k -isomorphic to quotients of $\mathcal{G}(k)$. Are there any examples? The motivating example here is the special case of Galois group schemes: If K/k is a finite separable field extension of k , the étale group scheme $\mathrm{Gal}(K/k)$ can be constructed as the quotient $\mathrm{Gal}(K/k) = \mathrm{Gal}(K/k)/R$, where R is the subgroup of $\mathrm{Gal}(K/k)$ consisting of those automorphisms that induce the identity on k . The case of Galois groups is important for Galois cohomology. So I am not looking for an example where \mathcal{H} is a Galois group, but perhaps a more exotic example is possible. Any ideas or references would be greatly appreciated! A: This is a bit of a more less exotified version of comments: Thinking about the following setup, I think you will find the answer (at least for the more exotic example) very helpful: Let p be a fixed prime number and F_p be a finite field of p elements. Let $G = \mathbb{Z}/p\mathbb{Z}$
