Immune monitoring of unrelated bone marrow transplantation in children: clinical and biological aspects. The objective of this prospective study was to evaluate the clinical and biological immunological status of children receiving allogeneic bone marrow transplantation (BMT) as part of their treatment. Forty-three children (aged 1-18 years) diagnosed with haematological malignancies or immune deficiencies were included. They received haploidentical (n=24) or identical sibling (n=19) marrow grafts from their matched donor. A high degree of molecular chimerism was achieved using flow cytometry analysis. IgA, IgG, IgM and complement (C3 and C4) levels were measured pre-transplant and then 1, 3, 6, 9, 12 and 18 months after BMT. Reactivation of CMV was monitored using EBV-specific IgG and IgM serology. B-cell, T-cell and dendritic cell reconstitution was analysed in 25 children by surface and functional markers. The median follow-up period was 20 months (range: 2-29). The percentage of chimerism was maintained after BMT. There was a significant increase in the serum levels of IgG, IgA, IgM and C3 between day +9 and +18 post-BMT. All patients achieved IgG levels >1 g/L and >50% of patients had IgG levels >2 g/L. Five children presented a graft versus host disease. Four had mild acute GVHD and one had a moderate chronic form. The percentage of
