Contents Autodesk was founded in 1983, based in San Rafael, California. In 1998, Autodesk

---

bought the computer software company Corel to further develop CorelDRAW. The combined firm was then renamed Autodesk Corel, and the two companies were often considered a single entity. In 1999, Autodesk, now a very successful company, was acquired by Dow Jones for \$5.9 billion. Dow Jones retained a majority stake in Autodesk and

---

continued to operate the firm independently until April 2009, when Dow Jones sold its shares in Autodesk to privately held Investor AB. In 2007, Autodesk released AutoCAD WS and AutoCAD LT, which provides web-based and mobile access to the application. AutoCAD LT is a portable version of AutoCAD that does not require a computer. AutoCAD WS is a

---

desktop application for PCs. A desktop version of AutoCAD was first released in December 1982 as a package for the Apple Macintosh and Atari ST computers. There was no support for drafting or design operations such as placing objects in space, text or line labels, or graphical information such as the appearance of objects or properties. The

---

program was originally marketed as a desktop version of the software package AutoLISP which was being developed for the Apple II computer. AutoCAD was first developed by a team of engineers working under Charles Sharp at the Lawrence Berkeley National Laboratory. The initial release of AutoCAD was a milestone in CAD that

---

was the first CAD application to support entire drafting and design functions. It was also notable for being the first CAD software to be able to accept files from other CAD systems like the Drafting Assistant. In 1985, Autodesk introduced AutoCAD. The name comes from "automated CAD", because the program enabled users to design and draw using a

---

mouse, a first for CAD software. Its structure of drawing windows and drawing views allowed users to quickly view and access an entire drawing project from any window. In 1988, Autodesk released AutoCAD 2000, with significant updates to the design interface, new features and increased stability. AutoCAD 2000 was the first version of

---

AutoCAD to ship with hardware acceleration features and to be bundled with the latest versions of Microsoft Windows and Microsoft Office. Also new for AutoCAD was the ability to save drawing files for several hours without requiring a hard drive, as well as an improved drawing-file storage format that enabled file sizes to be reduced

Numbering scheme For numbering purposes, AutoCAD uses a system of numbers that identify segments and sub-segments of the drawing.

Objects are not numbered, however the starting point of a drawing is numbered as drawing number 1. 1 A starting number for drawings, is provided at the top of the page when a new drawing is created, or when a

---

page is saved with a new drawing on it. If a drawing has already been previously saved, the last saved page is kept as default. The default starting page number is always 1. 2 Each drawing is numbered sequentially. When a new drawing is created or a new drawing page is opened, the default drawing number is 1. 3 Each drawing is composed of

---

numbered segments, sub-segments, arcs, arcs of arcs and named arcs. Segments, sub-segments, arcs, arcs of arcs are always numbered, regardless of the drawing type. 4 Each named arc is named after its segment, sub-segment or arc number. When the arc number increases the arc name increases. 5 Sub-segments and arcs between segments are numbered within

---

the order of the segment they belong to, in the following order: back edge, front edge, left edge, right edge, top edge, bottom edge, vertex. The order of sub-segments and arcs is the same as the order of the segments they belong to. 6 The first object of a drawing is always numbered 1. Objects can be named for convenience, for example, in order to find a

---

component easier. Format of the drawing's title The format of the title of a drawing is a string of three characters of the following form: **XXXXXXX** where: X represents the drawing's number The number is composed of: The two digits of the drawing's number A string representing a letter. A list of letters are available for the formatting of the title:

Open the folder which contains the Exe file. If you are unable to open it, then first you need to open the Autocad with your product key. Open the keygen by double clicking on it. Double click on the Exe file for Activating your product. Close and restart Autocad. If the above steps are successfully

---

followed then the keygen is working properly. The activation was successful. Do not forget to change the password if you have an existing Autocad License. Do not forget to change the serial number if you have an existing Autocad product. Q: How can I return user input? I'm wondering if there is any way that I can make a prompt within

---

a function and return the value it receives. It seems so simple, but can't quite figure out how.

Here is the basic structure of

what I'm working with. `def`

```
choice_plus_minus(): choice =  
input("Choose your favorite of  
the following options:
```

```
+, -, or, none: ") while choice not
```

```
in ('+', '-', 'o', 'n'): choice =
```

```
input("Error! Please enter a
```

```
valid answer.") print(choice) if
```

---

choice == "+": print("You  
chose +") return choice if  
choice == "-": print("You chose  
-") return choice if choice ==  
'o': print("You chose o") return  
choice if choice == 'n':  
print("You chose n") return  
choice I'm trying to get a simple  
function that will make the user  
choose an option, and once they  
choose it, the print statements  
will change to the user's choice.

---

A: return will return to the calling function. You aren't actually returning to anything in your function at this point, so it's failing to do what you want it to do. You need to first change return choice to return choice and change the two lines after that to
