
JHelp Free

JHelp adds an easy-to-use help content window to your Java application. The help content includes pictures and text created using a standard html format. This means that help content creators can control fonts, font sizes, lines, colors, and hyperlinks. The sample to the left shows the hierarchy of help

topics and multiple subtopics that can be developed with JHelp. This provides a standard and intuitive user experience. Pages can be written in different character sets such as unicode allowing you to use other languages. Search capabilities in JHelp cover all help content. Familiar forward and backward controls allow the user to return to previous pages. JHelp also includes a Tips at Startup

dialog and an Accept Licence dialog that you can include with your program. JHelp can save you development time. It allows you to develop your help content independent from your main application. Content creation is easy using the included sample as a template. No java skills are needed to create the content pages and hierarchy. JHelp is designed to offer

you an easy way of developing help content. JHelp Description: JHelp adds an easy-to-use help content window to your Java application. JHelp Crack + [Latest]

JHelp is a free plug-in to the "Help Wizard" that provides an easy way of adding help content to your JFrame application. JHelp adds a standard html help window that can be placed anywhere in the JFrame. JHelp can be used with all languages that work with JHelp. All page content can be created in unicode characters using the provided sample as a template. JHelp includes a control set of the top

level help topics. Familiar forward and backward navigation is used to navigate to all pages in the help. This makes it easy for users to go back to a page they have previously viewed. Search capabilities allow users to find all pages of your help. If a keyword is not available a search is done of all content. JHelp comes with a set of built-in pages that demonstrate how to use all of the features of JHelp.

These are provided in the Help Resource file. JHelp comes with a tip at startup dialog that allows you to place it anywhere in your application as well as a "Accept Licence" dialog that will appear if you wish to include it in your application. These two dialogs are also provided with the sample project. NOTE: This is only a demo version of JHelp. It does not include all the features of the full

version. Support, Community, and Resources The JHelp Support Group is available on JHelp lists all the issues and news relating to the current versions of JHelp on this wiki. JHelp Discussion Forum is available on JHelp documentation, demos, and other materials are available for download at The jhelp.properties file is included in the JHelp zip file as a sample.

jhelp is a component that adds a 'Help' option to your application. It allows you to create and place help content, the content is created using a standard HTML format, so no programming is required. Jhelp is included with the J2SE. It is a component you can add to your application. Jhelp includes a small

sample of how to create help content using standard html. The Jhelp.jar file is used as the basis for all help content, this can be changed by using the build.xml file. Jhelp can save you development time. Jhelp can be used to create standalone help content that can be used with JDesktop, Netbeans, & Eclipse. Jhelp includes a small sample of how to create help content using the HTML template. This

document shows how to create and display a simple help content. Jhelp Description: Jhelp is a component that adds a 'Help' option to your application. What's New in the?

JHelp adds an easy-to-use help

content window to your Java application. The help content includes pictures and text created using a standard html format. This means that help content creators can control fonts, font sizes, lines, colors, and hyperlinks. The sample to the left shows the hierarchy of help topics and multiple subtopics that can be developed with JHelp. This provides a standard and intuitive user

experience. Pages can be written in different character sets such as unicode allowing you to use other languages. Search capabilities in JHelp cover all help content. Familiar forward and backward controls allow the user to return to previous pages. JHelp also includes a Tips at Startup dialog and an Accept Licence dialog that you can include with your program. JHelp can save you

development time. It allows you to develop your help content independent from your main application. Content creation is easy using the included sample as a template. No java skills are needed to create the content pages and hierarchy. JHelp is designed to offer you an easy way of developing help content. JHelp Features: The included JHelp sample application

allows you to see how JHelp works with real world content. The sample application allows you to add and modify pages and see the result in a frame. JHelp includes a Help Topic Viewer that allows you to browse the content pages by selecting an object on the frame. This is useful for initial help content planning. Content that is developed with JHelp can be saved in a variety of formats. The file

extensions for JHelp files are htm, html and jhp. JHelp uses standard and proprietary content extensions that are well supported on most help authoring tools. The sample application included with JHelp contains the following text extensions.

- * HtmlWith3d.js *
- htmlFile.css *
- jhelp-info-export.css *
- htmlfile-styles.css *
