CScan is a software utility designed to verify the integrity of a Microsoft Windows file. It can do so by comparing the Windows file's checksum to the checksums of the data stored on the file. Symbol-based and/or anti-virus security checks Most checks you can perform with CScan are applied with either a symbol-based or an anti-virus component. Symbol-based checks search for the file's patterns. All of CScan's symbol-based checks can be performed on the file, on a specific folder, or on a list of folders. Anti-virus checks are applied to the file. If an anti-virus component is available on the computer, CScan will scan the file against that component. If an anti-virus component is not installed, CScan will scan the file for potentially harmful files. Versioning information CScan allows you to view the software's version information, either for the file or for the file's checksum. Detection for known malware and encryption CScan can detect if a file has a Trojan. This will normally be the case when it is running on a computer that has been compromised. CScan can detect if a file has been encrypted with Microsoft's Advanced Encryption Standard (AES). This will usually be the case when the file is being used to hide malicious code. Prioritizing the analysis If you would like to prioritize the checks, you can select a "Low" priority for the first verification and then a "High" priority for the subsequent verification.
