The Auto Layer Mask feature allows you to see a black-and-white display of the active layer at any time in the layers panel. Photoshop has more than 200 features (called `_tools_`) available to artists and designers, so be sure to review all the help options available for an even more in-depth view of Photoshop. Photoshop works best with Macs and PCs, but on the Mac side, you can also work with the more limited Adobe Camera Raw, which has lots of additional tools for RAW-format images.

Figure 12-2: The interface is fairly straightforward, and the layers panel is your basic view for seeing your current image and the edits. The Layers Panel: A Quick Reference The Layers Panel, as shown in Figure 12-3, is where all your layers are displayed. (You can find more info on layers in the upcoming sidebar "Layers." — along with a slew of other nifty stuff.) **Figure 12-3:** The Layers panel provides everything you need to manipulate layers in the most common ways. To quickly access the panel: Click the Window button (located in the upper-left corner of the screen) and choose Layers. You can also use the keyboard shortcut `Control+F4` to display the Layers panel. The Layers panel is a great place to quickly group your layers in any useful order. For example, you may organize a set of layers by your images, and then create a folder for each project or collection of images. To move layers to a new folder, follow these steps: 1. Click the Add New Layer icon in the Layers panel to open the New Layer dialog box. 2. Click the New Layer icon in the Layers panel to create a new group of layers. 3. Double-click the group name or click it in the Layers panel. 4. Click the folder of your choice. 5. Use the pop-up menu just below the name of the folder to move the layers inside the folder. You can also drag a single layer onto another layer. Figure 12-4 shows a set of old family photos. Using the following steps, I created a new, duplicate layer, rearranged the layers, and then deleted a few: 1. To create a new layer, click the New Layer icon in the Layers panel

John Ward Jackson John Ward Jackson (1832 – January 24, 1909) was an American sculptor, portrait and portrait bust sculptor. His works include many sculpted heads for public works, including those for the American Sculpture Association, the United States Military Academy at West Point, West Point, New York, and the New York State Normal School in Poughkeepsie, New York. Personal life Jackson was born in Ripley, Ohio in 1832. He graduated from the National Academy of Design in 1853. He died in New York on January 24, 1909. Career While still a student at the National Academy of Design, he was commissioned to create the statue of Washington that stands in front of the Capitol in Washington, D.C. Soon after, Jackson was commissioned by the state of New York to create the Statue of George Washington, a gift to the people of the state. Jackson created additional works of public art in New York, including a now lost statue of Alexander Hamilton that stood in the rotunda of the New York State Assembly. During the Civil War, Jackson served as a private in the Union Army, seeing action at the Battle of Shiloh, during which he earned the rank of Sergeant. A fellow student at the National Academy of Design, Augustus Saint-Gaudens, made a study of Jackson's work and said of it "this is the artist's picture of life". Works Jackson created busts of many prominent Americans, including: Horace Greeley, American poet and editor, 1798–1872 Archibald Gracie King, American sculptor and historian of art, 1846–1933 Josephine Shaw Lowell, American hostess and author, 1827–1914 George Washington, founder of the United States of America, 1732–1799, 1832–1899, 1841–99, 1857–99 Senator William "Pitchfork Willie" Tillman, American politician, 1850–1924 One of Jackson's finest busts is that of Archibald Gracie King. It was carved in 1873 at the suggestion of Charles Henry Latrobe, and given to King for his home in Dorchester, Massachusetts. Jackson is credited with creating a bust of John Quincy Adams, Jr. for the Library of Congress in Washington, D.C. He was also a student of John Rogers Gilbert, who

We have previously shown that the survival of peptidergic sensory neurons is promoted through the ganglioside GD3, which is up-regulated at the axonal growth cone, and that this survival signals is conveyed to the neuron soma by an unidentified retrograde signaling molecule. The main objective of the present project is to determine the identity of this signaling molecule and its role in mediating the survival signals. To accomplish this objective, we have initiated the following approaches. 1) Treatment of dorsal root ganglion (DRG) neurons with neutralizing antibody to GD3, results in significant decrease of DRG neuron survival in vitro and does not affect the survival of cardiac ganglion neurons. Similarly, anti-GD3 antibody treatment of DRG neurons in vivo reduces the survival of these neurons. 2) During neuronal development, a mature neuron initially relies on trophic factor(s) derived from its target organ. After the onset of neurites, neurons survive without any further requirement for the target organ. GD3 is expressed at the growth cone of the developing neurons and is known to be involved in neuronal survival. By treating GD3 with an anti-GD3 antibody, we have found that the antibody-treated GD3 can neither promote nor inhibit the survival of the neurons. 3) The GD3 expressing DRG neurons generate GD3 on the cell body and promote the neuronal survival by a signal transduction mechanism. On the other hand, GD3 up-regulated on the axon promotes the neuronal survival through a signaling mechanism. By treating a cultured DRG neuron with a neutralizing antibody to GD3 or the corresponding ganglioside GM1, we could not observe any effect on the survival of the neuron. 4) Based on our observation that neurons from GD3 null animals are resistant to a neurotrophic factor, we have examined the effect of the GD3 on neurotrophic factors. For the retinal ganglion, the expression of GD3 is up-regulated in the receptor cells, but not in the trophic factor-producing cells. Both GD3 null mouse retina and GD3 null retina treated with an anti-GD3 antibody remain resistant to the GD3 dependent neurotrophin NT-3. 5) Our preliminary data suggest that the induction of GD3 at the growth cone of the DRG neurons through retrograde signaling molecules may be involved in the selective targeting of such growth cones. 6)

Using the expression vector constructs that contain the promoter of GD3 and the corresponding shRNA constructs, we
