The primary advantage of using Photoshop for production is the ability to make multiple images in different layers. You can work on one image, move or hide it and still keep it working. After you've created your final image, you can hide the layers that you no longer need to work on and easily bring them back later on.

Who Uses Photoshop? Anyone can use Photoshop, and people of all different sorts are using Photoshop. These include people who are hobbyists and craftsmen, people who make their living creating professional images for their jobs, and everyone in between. Thanks to the different tools it includes, Photoshop's immediate usability as a design and image-editing software makes it the most appealing to many people who are eager to get started.

The Basic Design of Photoshop Photoshop's interface consists of tools you can use to create and work with images. A typical image editing tool looks like the one shown in Figure 4-1, and Photoshop offers a lot more than that. **Figure 4-1:** The basic design of Photoshop allows you to create and edit images in a user-friendly way. The tools you use most often in Photoshop include the following:

Layers and channels: Layers are like sheets of paper on top of a big master image. They can be rearranged to add or remove image elements.

Channels are like layers, but they contain information about specific colors. When you paint with a color channel, you paint onto the actual image as opposed to a layer that can be hidden or moved around. Toolbox: This icon has a series of tools, a toolbar, and a navigation panel that you can use to modify your image. Navigation panel: This panel is the at-a-glance window that organizes the tools and the tools you've just used and enables you to return to the previous window quickly and easily. You can also save work by storing it in an image file (as with many other programs). Tools palette: The Tools palette has tools you can use to create various kinds of images. It is also where you access the Filter and Adjustment modules. Tool options: The Tool options, like the Scale tool (see Figure 4-2), enable you to modify aspects of the tool's design. **Figure 4-2:** The controls available on the Tool options are useful for setting up a tool's appearance. As a photographer, graphic designer, web designer and anyone who enjoys creating great looking graphics to use on your website, you'll probably need to use Photoshop at some point. As an example, here are several workflow concepts from Photoshop to illustrate the process that would be required to create the same sort of image from

the Elements version. In this post, you'll learn how to use Photoshop to edit images without getting frustrated. You'll also learn about the major differences between Photoshop and Elements so that you can determine which program is best suited to your needs and work style.

Create a New Project Create a new project by opening the new document from the File > New Project dialog box. Select the Graphic Elements template, and choose an appropriate name and location for your new file.

Print Settings Options First, set your paper settings. Choose the photo size you want to print by using the Photo Size menu. Set the page size and scale.

Photoshop Elements provides several sizes that you can use to create your print. I used the 4x6 size and chose 16-inch pages, but for you, you will probably want to use a different setting. If you need to print your file on a regular basis or use a scale other than 16x16, you can change this value in the Size menu. After your settings are applied, you may need to update the Print Size dialog box, depending on the size you have selected. If you are setting the page size to a larger value, you should update the print size dialog box to a smaller value. If you have placed your 4x6-inch photo into the 8.5x11-inch space provided, you can simply place the print in that space.

Open the Print dialog box by pressing the File > Print menu or by selecting File > Print. Make sure the Paper box is selected and the page size and scale you have

selected is selected in the Print dialog box. Press Print to print your photo. Create an Image for the Web Now that your photo is printed, you're ready to apply the same settings you used when using Photoshop. Open Photoshop, and create your new file by selecting File > New. If you have an image that you want to edit, click the Browse button and locate the file you want to use. After it is selected, press OK to create the new document. In the new 388ed7b0c7

Transgenic mice provide a valuable means of determining the events that underlie the expression and regulation of proteins encoded by genes of disease-causing significance. The primary goals of this project are the creation of transgenic mice capable of overexpressing or under-expressing the cystic fibrosis transmembrane regulator (CFTR). Such animals are useful for the analysis of CFTR's role in normal biology and may provide a means of determining the consequences of an excess or deficiency of this protein in a tissue or organ specific manner. The mutant transgenic construct includes a bacterial plasmid containing the cDNA of the human CFTR under the transcriptional control of the murine cytomegalovirus early/immediate (1) gene enhancer. The promoter sequences driving the human CFTR are the last 173 bp of intron 1 of the beta-globin gene and the first 587 bp of intron 9 of the murine alpha1-antitrypsin gene. Homologous recombination of the CFTR-containing plasmid into embryonic stem cells to create transgenic animals is being developed. To date, the CFTR transgenic mice which have been made are capable of producing and secreting functional CFTR in the epithelial cell secretory pathway. FAAPS-C forms a G protein-

coupled receptor with the MrgA2 receptor in Chinese hamster ovary cells. The antiproteinase hepsin has been proposed to play a crucial role in the development of several chronic inflammatory and autoimmune diseases. It is highly expressed in the lung, where it is associated with tissue damage and fibrosis in human lung diseases. Interestingly, hepsin can be produced by monocyte-derived macrophages and dendritic cells. Moreover, lymphocytes, endothelial cells, and fibroblasts also express hepsin. The function of hepsin in these cells, however, remains unknown. We have previously shown that the N-terminal hepsin sequence binds to the human bradykinin B2 receptor (B2R) and human muscarinic M3 receptor, and we postulated that hepsin may interact with other G protein-coupled receptors. As a first step in that direction, we searched a Chinese hamster ovary cell line for hepsin binding. The MA-CHO-L1 cell line was used, since this cell line endogenously expresses G protein-coupled receptors (G

Martial Arts, Military and more. Thursday, January 05, 2006 BaDoin' Boats? That's what I'm feeling here in Palm Harbor, Florida this week. I'm staying with my Aunt for Christmas, but before her I had the pleasure of a week with my Grandmother, Aunts, and Grandfather. It was

over at my Grandmother's home, built in the late 60's by Grandfather. This is a view of the back yard, and that house is under construction at the bottom. Hmmmm, not sure if I have a photo of that! I'll have to check. We saw a lot of birds, the old mama Canada goose which kept a close eye on the flock of geese that were with her, lots of blue herons, and the, "My foot, that was ugly!" geese.. it's ok though, she had a good giggle and we had some good laughs. Oh, did I mention we also saw a lot of water? The house has a fairly large back yard and the living room area sits right over a grass filled pool with a waterfall in it. At the end of the grassy pool are various bushes and trees. I knew from the walk from the car, but the time spent watching the birds with my Grandmother, that the pool was close to the ground. As it turns out, my Aunt has the perfect winter coat for her swim! As I watched her slide into the cool water, I could see why! She had a nice and cool setting for her skin. What makes my skin even better is that I'm sitting in the shade at the moment, but if I'm in the sun today, I'm sure I'll tan myself to death. Speaking of sweaters and skin... Crapola! I can't seem to find the one I posted in the old post that I thought I had placed... Silly me. I was going to post a photo of me wearing the "Barely-copper-john" sweater, but I can't seem to find it anywhere. So I'll have to start all over with a different blog. Another week here. I did take off work for the holiday and it was sooo good. I haven't had a

weekend off since... oh, I don't know, well before the last time I took off a week of work. Tooo many trips to the doctor and way too much
