Thanks for looking over a photo for me. It was a very quick and efficient review. Though I'd still like to see much more feedback in the photo, and only things like a narrow band filter to adjust exposure and exposure latitude, negative strength and color temperature. The colors are quite nice, and look natural. Also, it makes it well know the images are being adjusted, and not simply uploaded from a different file. In the past, it would always scan saying it was a DNG, and without any metadata. I'm really liking the Live Co-Review workflow. It's a nice way to get feedback on your images and respond immediately. I found I sometimes make edits to my images based on my mood, which may not be what the other person edited, so this feature is a nice way to make sure I didn't miss any important changes. You can use this feature to enhance whatever workflow you prefer. While many photographers and designers may not use the full version of Photoshop, the additional power provided by interaction with the Adobe Creative Cloud will allow you to easily create and edit your photos, apply a variety of filters to them, paint over a layer or multiple layers, as well as produce a larger amount of high-quality files than ever previously. Over the last couple of years, we've seen Photoshop move away from its more traditional Windows-only roots, and now it seems photography app makers all across the globe are happy to make the jump to the new operating system as well. This isn't entirely new because apps like Lightroom have long offered a Photoshop-like app for OS X, but just how far have the Mac version of the software progressed? Below we round up the best photography apps for OS X, in an attempt to showcase some interesting options and point to where things have hopefully improved in recent years.
