The most interesting new feature of Lightroom 5 is the ability to work with RAW (not-TIFF/CR2) files without converting to 16 or 24 bits (as Adobe does in Photoshop). Lightroom 5 lets you work with files in such an uncompressed state, and perhaps most importantly, you can use this standard mode of delivering RAW files to Apple and Android devices. Yes, you'll need to be comfortable with developing the raw pixel data that composes your RAW image before you open the file in Lightroom. You can develop the raw image data in Lightroom 5 itself. Many professional photographers are already working this way and develop all their images in Lightroom. Today we will consider what improvements can be discovered in Lightroom. In the Lightroom released in 2013, i.e. Lightroom 3, Lightroom had a basic color panel from where you could choose the colors of a RAW file, similar to the one that Photoshop has. As of Lightroom 4, released in 2014, Lightroom has gained more of photographic editing functions. For example, in version 4, you have a basic color panel from where you can change only the volume of a specific color (e.g. red), and unlike Photoshop, you can't go into the detail of other colors. In Lightroom 5, released today, some of the previous color editing functions have been added. In other words, Lightroom 5 has become much more photo editor than its previous version. With Lightroom 5, Adobe has managed to streamline the Lightroom interface. The learning curve of Lightroom has been reduced, and the time needed to pass through the sequence of functions has shortened significantly.
